

ABSTRACT OF THE DISCLOSURE

[0118] A voice enabled interactive (i.e., automatic) drug and medical information system and method for converting and transmitting on-line drug and medical information events into real time, dynamically generated interactive speech and voice recognition responses for delivery to
5 telephone and mobile devices of a user. Files and documents are processed through speech recognition and text-to-speech systems for converting content, speech and audio into generated voice instructions. The documents contain software developed instructions that generate and process speech recognition responses and text to speech transmissions that are capable of being transported between users and the interactive drug and medical information system via a mobile
10 device or telephone of the user in an interactive manner in order to create, transmit, receive and modify on-line drug and medical information events and member profile information for the purposes of processing and interacting with online drug and medical information events.
